

## Description

The j1xx tasks are designed to take a bit more effort than the j0xx tasks. As mentioned in class, I am a big fan of youtube. So the notion that there is a javascript library for managing youtube caught my interest early on. Task j100 is about using the library to create a web page that lets a user choose among different ways of playing a few different youtube videos. Again, this task is split up into stages, as was done with j001.

Before starting this task, you want to glance over the one page 'tutorial' at <http://tutorialzine.com/2015/08/how-to-control-youtubes-video-player-with-javascript/>, so that you can see what basic functionality you have available. Since this comes from 2015, it is possible that newer versions have changed things. When I used it, I used it on Chrome, so I am not sure about general browser compatibility of this either (one of the reasons I am a fan of Chrome is that I am a fan of youtube and I figure that Google has to make sure youtube always works on Chrome).
